**ABSTRACT.** In the paper we presented vulnerable species, almost threatened species of plants from Râiosu and Buda Mountains, Făgăraş Massif. Not surprisingly, the largest families contain the largest number of threatened species. This fact requires an efficient management of the two mountains where they vegetate.

**Key words:** vulnerable species, threatened species, Râiosu and Buda Mountains.

**REZUMAT.** Lista Roșie a plantelor amenințate din Munții Râiosu și Buda, Masivul Făgăraș. În lucrare sunt prezentate speciile vulnerabile, aproape amenințate, din munții Râiosu și Buda, Masivul Făgăraș. Deloc surprinzător, familiile cele mai mari conțin cel mai mare număr de specii amenințate. Acest fapt necesită un management eficient al celor doi munți unde acestea vegetează.

**Cuvinte cheie:** specii vulnerabile, specii amenințate, munții Râiosu și Buda.

### INTRODUCTION

In the Red List statistic are given for each family the number of species listed as threatened. A total of 23 families of vascular plants contain vulnerable or threatened species. Not surprisingly, the largest families contain the largest number of threatened species. This fact requires an efficient management of the two mountains where they vegetate. Red list species was distributed by the following categories: extinct, endangered, vulnerable, rare, critically endangered, endemic to Romania.

### MATERIALS AND METHODS

The Red List considered for this analysis is: Boșcaiu, Coldea and Horean (Boșcaiu et al., 1994), Dihoru and Negrean (Dihoru & Negrean 2009), Oltean (Oltean et al., 1994). Endemic taxa are considered according to Ciocârlan (Ciocârlan, 2009). The IUCN categories used in this paper are:

**Endangered (E)** - Taxa in danger of extinction whose numbers have been reduced to a critical level or whose habitats have been so drastically reduced that they are deemed to be in immediate danger of extinction.

**Vulnerable (V)** - Taxa that is not Critically Endangered or Endangered but is facing a high risk of extinction in the wild in the medium-term future.

**Rare (R)** - Taxa with small world population that are not at present Endangered or Vulnerable, but are at risk.

**Critically Endangered (CR)** - Taxa that is facing an extremely high risk of extinction in the wild in the immediate future.

## RESULTS AND DISCUSSION

In the Râiosu and Buda Mountains where identified 129 rare, vulnerable or endangered taxa which were presented in the table 1 (Stancu, 2005).

Table 1 – The Red List of the threatened plants from Râiosu and Buda Mountains.

**Legend:** End\* - restricted range endemic in Romania; End\*\* - Carpathian endemic;  
End\*\*\* - Carpatho Balkan endemic.

## CONCLUSIONS

The table shows that there are: 8 - Endangered taxa 1 - Critically Endangered taxa, 4 - Vulnerable/rare taxa, 2 - Vulnerable taxa and 114 - Rare taxa. The following families have the highest percentage in threatened taxa: Asteraceae -

15, Orchidaceae - 12, Cariophillaceae - 11, Poaceae - 9, Primulaceae - 6, Ranunculaceae - 5.
