

**BUTTERFLIES (S.ORD. RHOPALOCERA) OF THE PROTECTED AREA
THE LAWNS OF SĂLAŞU DE SUS
(HUNEDOARA COUNTY, ROMANIA)**

SILVIA BURNAZ

Abstract:

Butterflies (S.ord. Rhopalocera) of the protected area *The lawns of Sălaşu de Sus* (Hunedoara County, Romania)

The paper presents the checklist of the Macrolepidoptera species (S. ord. Rhopalocera, Ord. Lepidoptera) recorded from the protected area *The Lawns of Sălaşu de Sus* located in Haţeg Basin (Hunedoara County). An endemic association *Peucedanum (rocheliani) – Molinietum coeruleae* Boşcaiu 1965 edifies the coenoses of this area. Actually the natural reserve is part of the natural park known as *The Geopark of Dinosaurs-Haţeg Country*. A total of 83 species have been recorded from this protected area. In this lawns, *Euphydryas aurinia*, *Maculinea arion*, *Maculinea teleius* and *Maculinea alcon* find favorable conditions for their life-cycle.

Key words: Macrolepidoptera, checklist, The lawns of Sălaşu de Sus

Rezumat

Fluturi de zi (S. ord. Rhopalocera, Ord. Lepidoptera) din aria protejată Fânațele de la Sălașu de Sus (Județul Hunedoara, România)

Lucrarea prezintă lista sistematică a speciilor de Macrolepidoptere diurne identificate în aria naturală protejată *Fânațele cu narcise de la Sălașu de Sus* (Județul Hunedoara). Cenozele din această rezervație sunt edificate de asociația endemică *Peucedanum (rocheliani) – Molinietum coeruleae* Boşcaiu 1965. În prezent, rezervația face parte din parcul natural cunoscut ca Geoparcul Dinozaurilor-Țara Hațegului. 83 specii de Macrolepidoptere diurne au fost identificate din această arie protejată. În aceste fânațe, *Euphydryas aurinia*, *Maculinea arion*, *Maculinea teleius* și *Maculinea alcon* găsesc condiții favorabile pentru dezvoltarea ciclului lor biologic.

Cuvinte cheie: Macrolepidoptera, lista sistematică, Fânațele de la Sălașu de Sus

Introduction

The Lawns of Sălaşu de Sus is the only natural reserve of Hunedoara County in which *Narcissus stellaris* is protected. This species forms beautiful coenoses together with other species of *Peucedanum (rocheliani) – Molinietum coeruleae* Boşcaiu 1965 association. At present, this protected area, situated from geographically point of view in the Basin of Haţeg,

is included in the natural park known as *The Geopark of Dinosaurs-Hățeg Country*. The Retezat Mountains border the southern part of this natural reserve. It covers an area of 20 ha widespread between two localities: Sălașu de Sus and Nucșoara.

The scientific and fitogeographical importance of this association is due to the presence of *Peucedanum rochelianum*, an endemic species, occurring on both banks of the Danube but with an extreme limited range. The conenoses of the association have a mesophilous character but hygrophilous and mesohygrophilous species are also present, especially near Sălaș Valley. Beside the two dominant species *Peucedanum rochelianum* and *Molinia caerulea* other 137 species form the inventory of the vascular plants (mono and dicotyledonata) of this association. In spring (May-June), the flowers of *Narcissus stellaris*, *Orhis morio* and *Iris sibirica* are abundant. In July and August, *Gladiolus imbricatus*, *Gentiana pneumonanthe*, *Dianthus carthusianorum*, *Peucedanum rochelianum*, *Sanguisorba officinalis* and *Scabiosa ochroleuca* give the color of these lawns.

If this protected area is known from botanical point of view, fauna and especially Macrolepidoptera fauna was not published.

During 2005-2008 we have collected and identified the butterfly's species (S. ord. Rhopalocera) of this area.

The aim on this paper is to present the checklist of the species of butterflies accompanied by data about their frequency, fly period, adults and caterpillars plant resources.

Material and methods

Butterflies were collected every year, from May to September, using an entomological net. Samples were made both in the lawns with *Narcissus stellaris* but also in the habitats of Sălaș Valley that borders the protected area.

The identification of the species was made after NICULESCU (1961, 1963, 1965), STILL (1996), FELTWELL (2001), TOLMAN & LEWINGTON (2007). The nomenclature and the systematic of species used in this paper are those published by RÁKOSY (2002) and SZÉKELY (2008).

Results and conclusions

The habitats of the protected area of Sălașu de Sus offer favourable conditions for Lepidoptera fauna, especially for butterflies. In 2005-2008 we have identified 83 species of

butterflies. The checklist of the species is accompanied by data about the flying period, ecological exigencies, the frequency of species, and larval and adult plant resources (Tab. 2).

The frequency of the species is established according RÁKOSY & VIEHMANN (1991) classification.

The majority of the species identified in this area belongs to Nymphalidae (40 species) and Lycaenidae families (26 species) (Tab. 1).

Tab. 1 – The structure of Rhopalocera families and the number of species recorded from Sălașu de Sus protected area

Family	Number of species
Hesperiidae	7
Papilionidae	2
Pieridae	8
Lycaenidae	26
Nymphalidae	40

The majority of the species are characteristic for the habitats of the mesophilous and mesohygrophilous meadows, but many species were collected at the edge of the alder coenoses which are widespread in the valley of the river. Like in other studies we try to identify the plants used as nectar resources by butterflies. *Dianthus carthusianorum*, *Filipendula ulmaria*, *Vicia cracca*, *Viola tricolor*, *Narcissus stellaris*, *Veronica chamaedrys*, *Senecio vulgaris*, *Sanguisorba officinalis*, *Medicago sativa*, *Origanum vulgare*, *Urtica dioica*, *Centaurea pannonica*, *Hypericum perforatum*, *Inula hirta*, *Potentilla erecta*, *Tanacetum vulgare*, *Telekia speciosa*, *Trifolium repens*, *Trifolium pratense*, *Galium verum*, *Gentiana pneumonanthe*, *Aster amellus*, *Scabiosa ochroleuca*, *Scabiosa columbaria*, *Gladiolus imbricatus*, *Thymus serpyllum*, *Leucanthemum vulgare*, *Cytisus nigricans*, *Cirsium canum*, *Lotus corniculatus*, *Ranunculus repens*, *Lathyrus pratensis*, *Prunella vulgaris*, *Stachys recta*, *Chamaespartium sagitale*, *Cichorium intybus*, *Tanacetum vulgare*, *Sambucus racemosa*, *Solidago virgaurea*, *Sambucus racemosa*, *Knautia arvensis*, *Crataegus monogyna*, *Rubus caesius*, *Rosa canina*, *Linum hirsutum*, *Peucedanum rochelianum* and *Achillea ptarmica* are the studied flowering plants as nectar resources.

Abbreviations: **EE**= Ecological exigencies: M-Mezofilous species; Mt-Mezotermofilous species; Xt-Xerotermofilous species, U-Ubiquist; Eu- Euritope; Mg- Migratory Species; **STL**- Larval Food Plants; **PF-NS**=Plant flowers-Nectar Source; **F**=Frequency: VF= Very Frequent species (over 16 individuals/day); RF= Relativ frequent species (5-10 individuals/day); F=Frequent species (10-15 individuals/day); R= Rare species; VR= Very Rare species (1-4 individuals/generation) (after RÁKOSY & VIEHMANN 1991); **FP**= Fly Period

Concerning the frequency (according to RÁKOSY & VIEHMANN 1991 classification), the majority of the species are very frequent and represent 53% from the total of the species

(Fig. 1). 21% of the species are relative frequent and 16% are frequent species. Rare and very rare species are represented each other by 5% from the total of the species.

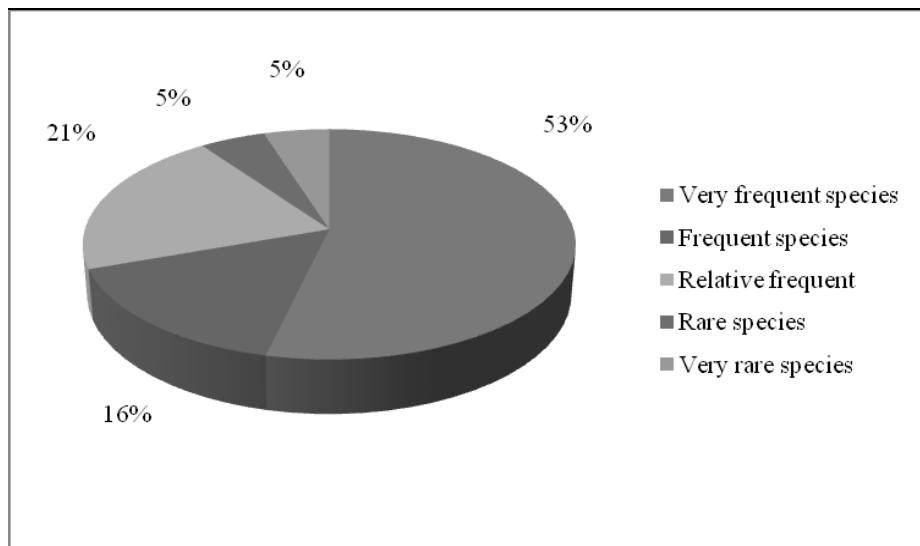

Fig. 1 – The frequency of the Macrolepidoptera species of Sălașu de Sus protected area of Sălașu de Sus

In this protected area a wide variety of the flowering plants are visited by butterflies for searching nectar. The most visited flowering plants are: *Dianthus carthusianorum*, *Filipendula ulmaria*, *Vicia cracca*, *Viola tricolor*, *Narcissus stellaris*, *Veronica chamaedrys*, *Senecio vulgaris*, *Sanguisorba officinalis*, *Medicago sativa*, *Origanum vulgare*, *Urtica dioica*, *Centaurea pannonica*, *Hypericum perforatum*, *Inula hirta*, *Potentilla erecta*, *Tanacetum vulgare*, *Telekia speciosa*, *Trifolium repens*, *Galium verum*, *Gentiana pneumonanthe*, *Aster amellus*, *Scabiosa ochroleuca*, *Lotus corniculatus*, *Gladiolus imbricatus*, *Leucanthemum vulgare*, *Peucedanum rochelianum* and *Achillea ptarmica*. The choice of the flowering plants depends on various factors: the colour preferences, the depth of corolla, the length of the proboscis. Bivoltine or multivoltine species may change their preferences due to seasonal variation in available flowers (BAKOWSKI & BORÓN 2005). The quality of nectar and its concentration in sucrose are also important in the relationship butterflies-flowering plants (RUSTERHOLZ & ERHARDT 1997). Nectars of butterfly-pollinated flower tend to have higher concentrations of amino acids than do flowers pollinated by bees and many other animals, suggesting that amino acids are important attractants of butterflies to flowers (ALM, OHNMEISS, LANZA & VRIESENKA 1990). MEVI-SCHUTZ & ERHARDT (2003) show that the preference for nectar amino acids varies between different groups of pollinators. Females of several butterfly species have shown a clear preference for nectar mimics containing amino acids over nectar void of amino acids. Tests carried out showed that females of *Araschnia levana* raised on the low quality larval diet were smaller and showed a significant preference

for the nectar mimic with amino acids, whereas females raised on the high quality diet were larger and showed no preference. Larval food quality did not affect male mass, and male butterflies were indifferent to nectar amino acids. Consequently, female butterflies may compensate for poor larval nutrition by selectively feeding on nectar containing amino acids. These results demonstrate the nutritional plasticity of holometabolous insects and the potential evolutionary significance of nectar amino acids for both plants and their pollinators.

Some species of nymphalids only exceptionally visit flowers and feed instead on tree sap, juice of rotting fruits and other decaying substances. For instance, *Apatura iris* feeds on honeydew produced by aphids as well as tree sap. Males visit the ground on occasion, in order to obtain salts from dung or from the surfaces of roads. *Apatura ilia* has been seen on animal droppings. *Vanessa atalanta* and *Inachis io* prefers fermenting fruits, sap flows on trees, dung and visits flowers only when these are not available.

The following species are rare and very rare in this protected area:

Maculinea arion (LINNAEUS, 1758) – 3♂♂ 22.06.2006, 1♂ 18.06.2007 at Sălașu de Sus lawns. This species prefers dry habitats of Sălașu de Sus natural reserve. Females lay their eggs on flowers of *Thymus serpyllum*. Younger larvae eat pollen and seeds of Thymus and then drop to the ground. They are attractive to *Myrmica sabuleti*. Pupation takes place in the nest of ants. Adults emerge the following summer and live about three or four weeks. The adults fly in June-August and visit *Achillea ptarmica*, *Scabiosa ochroleuca*, *Filipendula vulgaris* and *Dianthus carthusianorum*.

Maculinea teleius (BERGSTRÄSSER, 1779) – 1♂ 15.07.2007; 2♂♂ 22.07.2008; 1♂ 3.08.2008. It is a rare species in this protected area. Adults fly from July to the beginning of August, especially in wet meadows and visit *Achillea ptarmica*, *Prunella vulgaris*, *Leucanthemum vulgare* and *Scabiosa ochroleuca*. In their early stages larvae breed on *Sanguisorba officinalis*. In their last, fourth instars', they are adopted by a species of *Myrmica*. It is listed in the Red List of Butterflies of Romania as an endangered species (RÁKOSY, 2002). It is also a protected species and listed as a species of national interest in the 4 Annex of the Emergency Ordinance of the Romanian Government no. 57/2007.

Carcharodus floccifera floccifera (Zeller, 1847) - It is a relatively rare and localized species in Romania fauna. Adults fly in May-June and visit *Stachys recta*, *Telekia speciosa* and *Narcissus stellaris*. Larval food plant is *Stachys recta*.

It is listed as near threatened-Vulnerable taxon in The Red List of the Butterflies of Romania (RÁKOSY 2002).

Concerning *Maculinea alcon alcon* (DENIS & SCHIFFERMÜLLER, 1775), many individuals (more than 10 individuals/day) were observed especially in June and July in a damp habitat near Sălaș Valley. The adults especially visit *Centaurea pannonica*, *Cardamine pratensis*, *Achillea ptarmica* and *Leucanthemum vulgare*. Larvae breed on *Gentiana pneumonanthe* and finish their stage in the ant nests. *Maculinea alcon* is listed as a species of national interest in the 4 Annexes of the Emergency Ordinance of the Romanian Government no. 57/2007.

Neptis hylas (LINNAEUS, 1758), listed as a species of national interest in the 4B Annex of the Emergency Ordinance of the Romanian Government no. 57/2007, is very common in the protected area. The adults fly in July-August at the edge of the forests and rarely visit *Cirsium arvense*. Larvae feed on *Lathyrus* sp.

Euphydryas aurinia aurinia (ROTTENBURG, 1775) is a common species in this area. Concerning the frequency, more than 10 individuals were seen each day in the second decade of May, resting on *Carex* sp. Larvae feed on *Knautia arvensis*, *Succisa pratensis* and *Scabiosa ochroleuca*.

Brenthis hecate hecate (DENIS & SCHIFFERMÜLLER, 1775): 1♂ 15.07.2007; ♀ 20.07.2007; 2♂♂ 22.07.2008. It is listed as vulnerable species in the Red List of Romanian Butterflies (RÁKOSY 2002). In the protected area of Sălașu de Sus this species is relatively frequent. The adults fly from the middle of June to the middle of August and visit *Leucanthemum vulgare*, *Telekia speciosa*, *Aster amellus*, *Inula hirta*, *Senecio vulgaris*, *Solidago virgaurea* and *Sanguisorba officinalis*.

Brintesia circe pannonica FRUHSTORFER, 1911: 1♂ 22.07.2008. It is a rare species in this area. The adults fly in July-August at the edge of the forests. Larvae feed on *Bromus erectus* and *Festuca ovina* (SZÉKELY 2008).

Conclusions

The diversity of the flowering plants and the local climate of the protected area are favourable for the butterflies' communities. Most of the species from Sălașu de Sus have a high frequency but some species are rare and very rare such as: *Thecla betulae*, *Carcharodus floccifera*, *Satyrium w-album*, *Satyrium pruni*, *Brintesia circe pannonica*, *Maculinea arion*, *Maculinea teleius* and *Melitaea trivia*.

Euphydryas aurinia and *Maculinea alcon*, both of them protected in Romania and frequent species in this protected area, find favorable conditions for their life-cycle.
