

PONTIC SIGILLATA DISCOVERED IN THE GETO–DACIAN SETTLEMENT OF POIANA, NICOREȘTI COMMUNE, GALAȚI COUNTY

Mariana–Cristina Popescu

Sigillatele pontice descoperite în așezarea geto–dacică de la Poiana, comuna Nicorești, jud. Galați

Vesela elenistică și romană descoperită în așezarea geto–dacică de la Poiana (com. Nicorești, jud. Galați, România) și în mare parte aflată în colecția Muzeului Orășenesc din Tecuci, jud. Galați, a fost prezentată de–a lungul timpului în rapoartele de săpătură, în articole și în monografia dedicată sitului și, de asemenea, în studii dedicate importurilor elenistice și romane descoperite pe teritoriul Daciei pre–romane sau într–un studiu special dedicat ceramicii de import din așezarea amintită. O reevaluare a ceramicii descoperite în situl de la Poiana a permis identificarea mai multor clase de ceramică elenistică și romană, dintre care sigillatele pontice fac subiectul prezentului articol. Din lotul de vase elenistice și romane pe care le–am avut la dispoziție pentru studiu am identificat 184 de sigillate pontice, piese întregi și întregibile, ori fragmente de vase cu decor specific acestei clase de sigillate care, din punct de vedere funcțional, se pot grupa în două categorii: vase pentru servit și vase pentru băut. În ceea ce privește formele de vase, am identificat patru forme Hayes (Hayes I, Hayes V, Hayes VIII și Hayes X) și trei forme care, pe baza analogiilor nord–pontice și a pastei similare cu a formelor Hayes, pot fi atribuite aceleiași clase ceramice.

Key words: Roman pottery, Pontic sigillata, Geto–Dacian settlements, North Pontic sites, Romania.

Pontic sigillata, a pottery class manufactured during the 1st and the end of the 3rd c. AD by the workshops in the basin of the Black Sea, is well documented in sites north of Pontus and also signalled in sites from Romania and Bulgaria¹.

The centre or centres manufacturing such pottery remain unknown for the time being. Although they are regular in the aforementioned sites during the period between the end of the 1st c. BC – 2nd c. AD, currently, there is no sufficient data that would establish their origin from one specific site or, at least, specific area. Consistent information related to the sites in northern Turkey (Pontus and ancient Bithynia)² are missing; in Histria's case, one may not clearly ascertain the existence of the own production of luxury pottery during the Roman period³; in the case of the sites in the north of the Black Sea, current state of research is defined as an intense period of material collection and issue of preliminary studies and it is estimated that: “in a few years time, it will be possible to complete a detailed classification of Pontic sigillata from the North Pontic region”⁴.

First shapes of Pontic sigillata were classified by T. N. Knipovich on the occasion of processing the red–slipped pottery uncovered at Olbia, Tiritake and Mirmekion, which were

attributed to the large centres known at that time: Arezzo, Samos and Pergamum⁵. Kropotkin also publishes a few exemplars belonging to this class under the name of red–slipped Bosporan pottery⁶. J. W. Hayes drafts the first basic classification of Pontic sigillata based on Knipovich and Kropotkin publications⁷.

D. Zhuravlev proposes three typological series for this *sigillata* category differentiated upon shapes and chronology as follows: *Pontic sigillata A*, massively diffused during the second half of the 1st c. to the first half of the 2nd c. AD; *Pontic sigillata B*, manufactured from mid 2nd c. and *Pontic sigillata C*, registering a period of maximum distribution during the 2nd – 3rd c. AD⁸. The cited author does not provide many details regarding the shapes included in each typological series, limiting to only technical – fabric, slip, decoration, firing – and chronological information and publishes only a few plates comprising most representative shapes of the first two typological series, while the majority of Hayes shapes are included in the *Pontic sigillata A* series⁹.

To Pontic sigillata are characteristically tableware: drinking ware (cups, beakers, kantharoi), pouring ware (lagynoi, jars, jugs) and service tableware (plates, bowls). Additionally, the decoration made by barbotine technique present on lagynoi and drinking ware seems to be specific to Pontic sigillata¹⁰.

Pontic sigillata are rarely found outside the basin of the Black Sea and very few items were signalled in Athens, Corinth or northern Africa¹¹. A small number of additional exemplars were discovered in Ostia, yet they are considered exceptions not indicative for any trade activity, but which rather mirror the relations range this port held¹².

The items included in the catalogue were discovered following archaeological systematic excavations carried out in the Geto–Dacian site of Poiana (fig. 1, fig 2) and come almost exclusively from the collections housed with the City Museum of Tecuci, Galați district¹³. A Hayes X kantharos (40) in the collection housed with the former Museum of Antiquities of Bucharest, published by I. Glodariu, is an exception and we described it based on bibliographical information¹⁴.

Part of the items were published within excavation reports or special articles dedicated to the settlement¹⁵, yet they are difficult, if not impossible to identify. The items uncovered until 1969 were analysed and interpreted by I. Glodariu¹⁶, while a selection of pottery coming from Poiana was published in a special article dedicated to this material category¹⁷ and additionally, in the site monograph¹⁸.

¹³ I would like to thank Mrs. Silvia Teodor for amiable approval of my observing and processing of the items coming from the site at Poiana discovered following the archaeological excavations she carried out in this site or coming from previous digs; I would also like to thank the management of the Museum of Tecuci and its custodians for their help during my research.

Unfortunately many of the information regarding the context wherein the items were discovered is no longer preserved¹⁹, therefore we may not possess detailed observations regarding the circulation of Pontic sigillata in the site at Poiana. Moreover, in numerous cases, the inventory number and mark of the discovery context written onto the item do not correspond with the information entered into the inventory register. Even so, I preferred to record in the catalogue all data marked on the pieces, so a future identification would be made straightforwardly.

From the lot of Hellenistic and Roman items available to me, I succeeded in identifying a number of 184 *Pontic sigillata* – complete and restorable vessels or vessel fragments displaying decoration specific to *Pontic sigillata*. The material is fragmentary, yet in many cases the profile is complete or almost complete and the shapes could be restored rather precisely.

With one exception that would be discussed properly hereinafter, I identified four Hayes shapes and three forms based on the illustration presented by Zhuravlev that may be grouped in two functional categories: eating and drinking ware.

Eating ware is represented by *plates* of which *Hayes I*²⁰ are most numerous (pl. 1/1–3, 6). They have vertical slightly concave outside wall, bounded above and below on the outside by beveled mouldings, vertical thin, rounded rim delimited or not from the wall by fine grooves; almost flat floor and slightly concave on the inside, or deepened; beveled ring, short or tall (1–7). Fragments 8–25, broken in the majority of cases immediately over the moulding from the lower part of the wall, with similar fabric and slip to fragments 1–7, come most probably from Hayes I plates. Most analogies for this shape come from sites in the north of Pontus²¹ and also from Histria²².

Fragments 26 and 27 (pl. 1/26), come from a plate type characterized by curving wall concave on the inside, beveled downturned rim, slightly concave floor on the inside and the junction between wall and floor marked with a deep groove on the inside and a fine groove on the outside. This shape is illustrated by Zhuravlev among the shapes which he considered distinctive for the Pontic sigillata A typological series²³.

Pieces 28–31 (pl. 1/28) are the exceptional case I mentioned above. The shape as such – curved walls, slightly vertical rim or strongly beveled on the inside, convex floor on the inside, with flat resting surface and junction between floor and wall marked with a groove on the inside – does not appear either in Hayes typology or the shapes illustrated by Zhuravlev, although the fabric and slip are similar to those of the pieces 6–7, 14, 171, definitely Pontic sigillata shapes, allow their inclusion in the same pottery class.

Drinking ware is slightly more varied topologically:

*Hayes V*²⁴ *cups* (32–35, pl. 2), conical body; rounded slightly incurved rim with one moulding below or bounded above and below by mouldings on the outside; with the outside concave wall rises directly from the lines of the foot or outside concave wall and almost flat floor with groove inside at the junction between rim and wall; and flat resting surface or beveled ring. Closest analogies for such pieces are signalled again in the north of Pontus²⁵ and Histria²⁶.

²⁶ Suceveanu 2000, type XVII/5, p. 64, pl. 23/5; type XVIII/24, p. 73, pl. 27/24.

*Hayes VIII*²⁷ cups (36–39, pl. 2/36–37), bi-truncated cone body and concave slightly incurved beveled rim bounded above and below on the outside by beveled mouldings, separated from wall by grooves; concave base, inside; wall meets floor at an outside moulding and an inside fine groove. As shown by similar pieces identified in north Pontic sites²⁸ or at Histria²⁹, they have moulded foot.

*Kantharoi Hayes X*³⁰ (pl. 2/40–41, pl.3/42, 46) identified under both variants: bi-truncated cone body, angular in the junction area between wall and floor (40–47, 82); or bi-truncated cone body, rounded in the area of the maximum diameter (48–58, 65). Both variants exhibit vertical slightly inner wall with rounded rim, rounded base, flat floor, beveled ring and handle plate.

Fragments 58–64, 66–81, 83–92 may come from *kantahroi* belonging to any of the two variants described above. This shape has analogies in the north of Pontus as well³¹.

Globular cups identified in three variants: globular body, rounded rim, vertical or slightly outturned and junction between rim and wall marked with a fine groove on the outside (93–101, 103–113, 115–159, 179–182, pl. 3/93,150); globular body more flattened, rounded outturned rim, and the junction between wall and rim marked by fine grooves on the outside (102, 114, pl. 3/114); rounded rim, vertical or slightly outturned and globular beveled body (160 – 161, fig. 3/161). The three variants are characterised by rounded handles attached in the upper half of the body, concave floor with or without nipple on the inside and fine beveled ring. Fragments 162–178 may come from any of the three variants. This shape is illustrated by Zhuravlev among those which he considered typical for the *Pontic sigillata A* typological series³².

“*Collar*” cups (183–184, pl.3/183) with rounded rim, straight; “*collar*” concave on the inside, globular body rounded in the area of the maximum diameter, concave floor, short beveled ring and two rounded handles, slightly heightened and attached to the body immediately under the collar. This shape is also illustrated by Zhuravlev among those which he deemed characteristic to *Pontic sigillata A*³³.

The *fabric* of the pieces discovered in the settlement from Poiana may be micaceous comprising mica in its composition; hard, porous with voids, white inclusions and occasionally with fine sand inside; or hard, vitreous alike fragments (6–7,14, 28, 29, 171,). The fabric colour is generally red, reddish yellow or brown of various shades Munsell 5YR 7/4–6/3, 7.5YR 8/4, 5/6, 10YR 8/8, 8/6 and rarely Munsell 2.5 YR 7/4–7/8, 6/2, or 7.5 YR 6/1, 5/8.

The *slip* may be fine with metallic shiny or only flashy, occasionally with pearly patina; or thick, dull or shiny matte. Generally, the slip covers the vessels on the inside – in the plates’ case – and on the outside up to over the ring, and in certain cases, like the globular cups or *kantharoi Hayes X*, it covers the vessel on the outside up to over the ring and on the inside only in the upper part. When covering the full vessel, the slip is much diluted in the area over the ring. Occasionally, the slip may be applied onto the vessel with the aid of a brush, case when it is rather thick, at times polished and preserves traces of the brush used for application. The slip colour varies alike clay in the same chromatic Munsell range, from red to brown, being regularly with a tone darker than the fabric. Exception makes the slip of pieces 28, 29 which is

reddish yellow on the rim Munsell 7.5 YR 6/8 and very dark brown in the rest Munsell 7.5 YR 2.5/2; and fragment 171 which is very dark brown Munsell 7.5 YR 2.5/2 onto the body and reddish yellow over the ring Munsell 7.5 YR 6/8.

The association of particular fabric types with certain slip types does not seem to follow a rule and likewise, vessels made of good quality fabric do not necessarily exhibit corresponding slip or the opposite. The best example is piece no. 1 whose fabric is hard, porous including several voids, mica and fine sand within the composition and is covered rather carefully with a fine, compact and shiny slip.

The *decoration* of the pieces identified at Poiana is specific to Pontic sigillata: *rouletting* – simple, double or triple strips – onto the base, inside the plates (2,6,8,11, 16–19, 21–54, pl. 1/2,6) or the wall median part like the case of cup 37 (pl. 2/37); simple or double incised circles on fragments 1 and 25 (pl. 1/1); *barbotine*: vegetal or geometric motifs in the case of Hayes X kantharos (pl. 2/40–41, pl. 3/42, 65); vegetal motifs on the Hayes VIII (36, 38–39, pl. 2//36) cups' wall; “drops” (93–142, pl. 3/93, 114), “wheat grains” (143–148, pl. 3/146) or “leaves and drops” (pl. 3/149) like the case of *globular cups*. Many of them are also smooth (150–161, 169, 171, pl. 3/150).

We could identify a “*planta pedis*” stamp, type specific to *Pontic sigillata*, in a single case, inside plate no. 1 and it was surrounded by two fine incised circles (pl.1/1).

Following chart 1 and chart 2 one may notice that functionally, drinking ware predominate (93%) and globular cups are most numerous (49%). Compared to other pottery categories of the Roman period, Pontic sigillata represent noticeably the lot best represented in the settlement from Poiana (chart 3).

As mentioned by the beginning of the article, the simple reference to the items context of discovery does not allow chronological refinements concerning the emergence and use period of the *Pontic sigillata* in the settlement at Poiana and implicitly considerations regarding the controversial final date of the settlement³⁴. Unfortunately not even D. Zhuravlev's study, the most recent we could review, does not provide precise data on the pieces it illustrates as part of *Pontic sigillata* A typological series, mentioning only the period of their maximum diffusion – second half of the 1st c to the first half of the 2nd c. AD³⁵. The exemplars from Histria similar to those at Poiana are also dated largely in the 1st – 2nd c. AD³⁶. Only the items uncovered in the

barrow cemetery are dated closely: a Hayes I plate dated in the second half of the 1st century AD and a Hayes VIII cup dated in the first half of the 1st c. AD³⁷.

In order to further detail, we took in consideration only the dating proposed for Hayes shapes. Thus, the kantharoi Hayes X could have emerged in the settlement as early as the beginning of the 1st c. AD, the shape being dated in the first half or mid (?) 1st c. AD³⁸, while Hayes I plates and Hayes V and VIII cups by mid century (Hayes I plates being dated from the second half of the 1st c. AD until the 2nd c. AD and Hayes V and VIII cups by mid 1st c. AD deemed as the date when their production is initiated)³⁹.

Generally, the *Pontic sigillata* were discovered in the last inhabitancy level of the settlement at Poiana – a level dated from the beginning of the 1st c. BC and until mid 2nd century AD⁴⁰ – and reached the area only in the 1st century AD. It seemed rather interesting that we could not identify in the lot of analysed items shapes specific to the typological series Pontic sigillata B that start production from mid 2nd c. AD.
