

SIXTH-TO-SEVENTH CENTURY COIN CIRCULATION IN DOBRUDJA

Andrei Gândilă

Until the last decades, the study of the Byzantine coin circulation during the 6th-7th century AD attracted only a few scholars involved in Ancient Numismatics. Modern approaches, both in numismatics and historical research, made possible a few studies aiming to draw some guidelines on the coin circulation during the early Byzantine period¹. The present study does not intend to offer solutions to all the problems raised by the circulation of the early Byzantine coins in Dobrudja, nor does it try to give a final resolution in terms of statistical figures, being just an overview on the matter based on the contributions of a number of Romanian researchers in the past half century.

The geographical area brought into discussion should be the historical territory of the Late Roman province of Scythia, which includes the modern Romanian Dobrudja and the North -East corner of Bulgaria. Unfortunately, despite the large amount of coin finds, the present research in Bulgaria is less developed and the introduction of incomplete information could lead to a statistical distortion. Therefore the analysis at this point will be limited to the Romanian part of the province.

In chronological terms, the starting point of the discussion is the great monetary reform of Anastasius carried out in 498, which saw the introduction of new copper denominations used in circulation in Dobrudja the whole sixth century and the first decades of the next one. The first years of the reign of Heraclius' reign mark the downfall of the Danube limes and therefore the end of the coin circulation in the former Late Roman and Early Byzantine province of Scythia². The title announcing a study of the coin circulation during the sixth and seventh century should be seen as the period of time of real coin circulation, which, at least at this moment, is comprised between the above-mentioned span of time.

The coin sample for Dobrudja includes a rather significant number of coins, brought to light especially from the major urban centres of the province and to a lesser extent from rural settlements. The present total gathers a number of 2697 coins, of which 973 come from the yet unpublished collection of the Museum of National History and Archaeology at Constantza³, some of them with uncertain finding places, whereas for the other 1724 specimens we have all the necessary information to draw an analysis.

In order to reach certain historical and numismatic conclusions, a comparison⁵ will be kept with the M NHAC collection and the results coming from the capital Tomis⁶, as well as from the other important centres at Istrus⁷, Noviodunum⁸, Dinogetia⁹ and Halmyris¹⁰, where significant finds have been reported. The statistical result given by the "Dobrudja" lot signifies an average for the entire province, while the comparative analysis will try to emphasize the peculiarities of the coin circulation in the main early Byzantine towns, and on some occasions, in the larger rural settlements.

It is well known that the mere number of coins does not offer an accurate picture of the circulation during a certain period, due to the variety of denominations available on the market as fractions of the follis. Therefore the analysis will be opened with a discussion upon the situation based on the number nummia per year of reign, which brings a few changes compared to calculation of the coefficient called "number of coins". For the sake of the argument one example is worthy to be mentioned: while Justinian I stands in the first position by number of coins, he is surpassed by Justin II in terms of nummia due to the massive presence of dekanummia issued by Justinian I, whereas his nephew has less coins found, but of higher denomination.

Judging by the nummia per year of reign coefficient, Justin II leads with 36.62% followed at a considerable distance by Justin I and Justinian I, the latter on a somewhat striking 3rd position for a period considered as the peak of the early Byzantine economical and political life. As for the lower part of the classification, Heraclius comes with a dramatically low figure of 1.27%. This might be explained by his long reign and the scarcity of his coins in Dobrudja, especially after his first six years of reign, when the intensity of coin circulation was comparable to the time of Anastasius. This is a rather surprising association considering the two periods seen as totally different historical moments: the reconstruction process undertaken by Anastasius at the Danube¹¹, versus an epoch, so far considered as subsequent to the downfall of the limes¹².

A more complex picture is drawn by structuring the stray finds according to monetary reforms which affect the ratio between the gold solidus and its equivalent in bronze lbs. and therefore in folles, based on the legal weight standards of the follis¹³.

Heraclius	610-631	28/31	0.90	XIV	1024/31	33.03	0.72%	XIV
	(610-616)	(19/6)	(3.16)	(XIII)	(720/6)	(120)	(2.56%)	(XIII)

For the first interval (498-512) after the great reform, the coin circulation remains at a rather low level, considering that issues from this period of time are quite scarce in the Empire, except for the Oriental and Danubian limes¹⁴, where the early Anastasian folles and half-folles have been found in greater number. A significant increase in the number of finds is reported for the following stage, when both written and archaeological evidence witness an age of reconstruction at the Lower Danube, especially focused on the major fortified places. It is the case of Istrus and Dinogetia, where stamped bricks bearing the emperor's name have been found, or Capidava whose walls were rebuilt, most likely, during this period. In the capital city of Tomis, among other finds a lead seal of Anastasius has been uncovered. The social and economic life flourished once again proven by the number of private and public constructions erected inside the walls of the larger towns of the province¹⁵. Despite the achievements in the realms of finance and the special attention shown to this part of the Empire, the coin circulation did not reach a spectacular level in the urban centres and even less in the rural settlements of the province¹⁶.

The reign of Justin I saw a major increase of the coefficient of nummia/ year present on the market, 10.16%, double compared to the previous period and also the highest level reached during the interval 498-538, when the number of folles exchanged for a solidus remained unchanged¹⁷. His bronze coinage can be divided in two chronological phases - 518-522, with 34 specimens totaling 1080 nummia and 522-527, represented by 35 coins, for a total of 1010 nummia. The first phase is therefore better situated, showing a coefficient of 270 nummia per year, while the second gives only a coefficient of 202 nummia per year. As the situation remains quite balanced, we should wait for further results to shed more light on the two stages of his reign. In the capital city of Tomis we notice a totally different standing. Here, the coins issued by Justin I are placed in the first position with 14.85%, compared to the overall province, where it is placed on the 4th position. A possible explanation could be provided by the repercussions of the invasions led by the Antae and Slavs¹⁸. They might have affected especially the northern part of Dobruja, judging by the high currency levels noticed in the finds at Tomis and Callatis¹⁹. Despite the mentioned Barbaric incursions, the reign of Justin I represents a peaceful decade for the border province, as proven by archaeological evidence²⁰ testifying the strengthening of the Danube border.

The decisive phase of the reconstruction is known from its detailed description made by Procopius in *De Aedificiis*, as well as from the archaeological research at some important early Byzantine centres: Tomis, Ulmetum, Aegyssus, Halmyris, Istrus, Dinogetia, Libida, Argamum, Troesmis, or the fortress Callatis where a very suggestive inscription has been found - Ιουστινιανοῦ τοῦ φιλοκτίστου²¹.

²⁰ Al. Barnea in Al. Suceveanu and Al. Barnea, *op. cit.*, p. 172.

²¹ I. Barnea, in R. Vulpe and I. Barnea, *op. cit.*, p. 424.

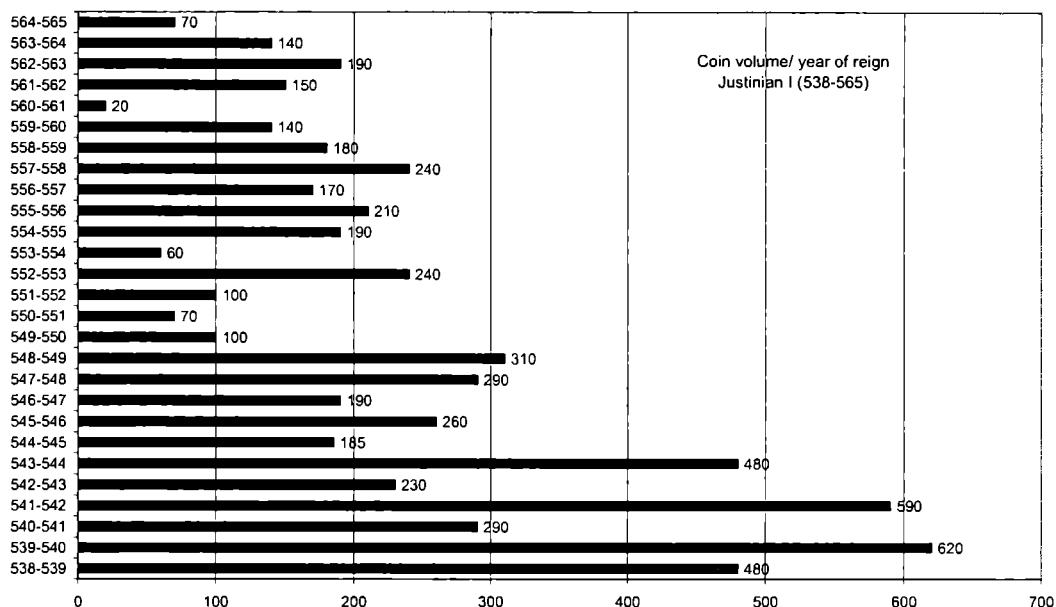

Four currency reforms divide the long reign of Justinian I: 527-538, 538-542, 542-550 and 550-565. During the first stage, while the value of the copper issues remains stable, a slight decrease can be noticed down to 8.64% for the provincial level and a sharper one in the northern part of Dobrudja, with 6.66% at the important fortress of Noviodunum. Procopius informs about the military events unfolded in the area: for three years the Byzantine general Chilbudos achieved some major victories against the Barbarian tribes North of the Danube, but soon after his death the enemy took the initiative and “from then on the River was always easy to cross by the Barbarians and Rome’s wealth easy to reach”²².

We cannot be certain to what extent this Barbarian military success which took place North of the Danube affected also the territory of Dobrudja. In the realms of numismatics a more precise chronology divides this period as follows: 527-532, giving a coefficient nummia per year of 132, while the second, 532-538, brings 145 nummia per year. Although the difference is not very striking, one still has to wonder how can the first period of time generously praised by Procopius for its major military achievements to present a smaller figure in terms of coin circulation, compared to a second period when the border was more insecure. It could be possible that Dobrudja was not economically influenced on the short term by the events placed higher on the Danube.

The reform of 538 introduced the regular dating on copper issues, which permits from this point a closer survey on the yearly volume of coins entering the provincial market. The short interval until the next currency reform (538-542) brings the highest coefficient up to this point with 10.75%, the 3rd position in the overall classification. An interesting development can be observed in the case of the fortress Noviodunum indicating a severe downfall to 2.16%, which might be related to the Courigurs attack in 540²³. The same explanation could be supposed for the situation at Troesmis, where only one specimen is available for this interval, dated 539-540, while at Niculitel in the rural area close to Noviodunum, two issues dated 541-542 have been found. On the contrary, the results from the fortresses Halmyris and Dinogetia, also situated in the northern part of the province, show a significant higher figure up to 20.03% for the latter. In what concerns the average of the currency volume for the entire Dobrudja, this time interval marks two peaks, the highest of all his reign: 538-539 (620 nummia) and 540-541 (590 nummia), noticing the downfall in-between during the Courigurs invasion, 539-540 (290 nummia).

²² Procopius, *De bello Gothicō*, III, 14, 6.

²³ I. Barnea in R. Vulpe and I. Barnea, *op. cit.*, p. 417; Gh. Poenaru Bordea, E. Nicolae and A. Popescu, SCN, II, 1995, p. 151.

The third stage (542-550) points out another reduction in the quantity of currency entering the provincial market down to 5.64%. Although its location is not certain, the granting of the fortress Turris to the Antae in 546 for defence purposes²⁴ seems to have had a powerful effect on the coin circulation. The large coin hoard of Anadolchioi, close to Tomis, seems to be buried during the same military events, judging by the last coin in the hoard dated 545/546²⁵. Observing the annual evolution of the coin volume for the entire province, we notice the peak reached in 543-544 followed by a sudden decrease the next two years, marked by the emperor's intention to settle the Antae North of the Delta (544) and the already mentioned granting of Turris (546).

During the last part of the reign (550-565) the decline is even more severe, the coefficient dropping to a dramatic 3.16%. The involution is probably caused by the settlement of the Slavs in the centre of the province, at Ulmetum²⁶, and their attacks southwards to Thrace, in 550-551. During this year the coin circulation in Dobrudja records the lowest value so far (70 nummia). In the interval prior to the great Coutrigurs offensive in 559, the yearly coin volume improves for the last time during the long reign of Justinian. The attack initiated by the Coutrigur tribes in 559 seriously affected the territory of Dobrudja. The hardest blow is received by the fortresses on the Danube. At Dinogetia the coin finds are missing for a period of ten years (557/8-566/7)²⁷, while at Capidava we notice several gapes for the interval 553/4-565/6²⁸. In the hoard found at Topalu, near Capidava, issues from 556/7 to 561/2 are missing as well²⁹.

In 562 the Huns and Bulgarians invade the Empire, while the Avars led by Baian threaten to take up Dobrudja. From the numismatic point of view, the coin flow drops dramatically in 560/1,

²⁴ Procopius, *De bello Gothicō*, III, 14, 32-33; I. Barnea in R. Vulpe and I. Barnea, *op. cit.*, p. 418; Gh. Poenaru Bordea, E. Nicolae and A. Popescu, SCN, 11, 1995, p. 152. For the location of Turris at Barboşii (Galatz County) stands the offer made by Justinian to the Antae two years earlier, to settle as foederates on the territory between the Danube Delta and the river Dnister; See: Al. Madgearu, *The Placement of the Fortress Turris*, BalkSt., 33, 2, 1992, pp. 203-208. Another hypothesis tries to place Turris at Tyras (Cetatea Albă), see: D. Gh. Teodor, *Romanitatea carpato-dunăreană și Bizanțul în veacurile V-X e. n.*, Iași, 1981, p. 18.

only two coins having been found until this moment. For the last stage of the reign we notice a considerable number of dekanummia entering the market, especially during the interval 556-565 (40 sp.), almost half of them being struck at Nicomedia (19 sp.). The tendency appears very clear in the cases of Tomis³⁰, or Halmyris³¹.

Justin II accedes to the throne in a difficult moment for the Empire, both political and economic, after his uncle's tremendous activity which taxed the Empire to the very limits of its resources. The new emperor was obliged to order a debasement of the follis, therefore increasing the inflation process already mounting during the last years of Justinian.

In terms of monetary reforms the reign of Justin II can be divided in two stages, 565-570 and 570-578. The first period produces a spectacular growth up to 18.57%. Judging by the follis/solidus ratio, it seems to be a rather inflationist tendency than a real economic boost³². However, for the first two years the coin volume maintains at a rather low level, possibly due to the Avar invasion of 566³³, for the next years to witness a tremendous rise up to an absolute peak of 1635 nummilia in 569/570. Among the finds we notice the presence of a large quantity of half-folles issued at Thessalonica. They represent almost half of the total number of specimens during the years 566/7 (9 sp.), 567/8 (16 sp.), 568/9 (21 sp.), 569/70 (21 sp.). Actually, the large scale diffusion of the Thessalonicaean issues represents a phenomenon whose origins are to be found during the last five years of Justinian.

The second stage marks a slight decrease, but the flow still remains at a very high level, on the 2nd place in the overall classification for the 6th-7thc. This interval stands in the first position judging from the results coming from the major fortresses in the northern half of the province, which might lead us to the conclusion that the southern area was less supplied with new issues during the second stage. As prove stands the lower figure from Tomis (14.24%) and the result from Capidava of 78 numimia per year in the first stage, compared to 52.5 numimia per year in the second one.

The flow abruptly dropped after 572, as Baian initiated a new offensive (573)³⁴, only to reach a new and final peak in 574/5 (1460 numimia). This might be a possible effect of the *donativa*, a phenomenon that can also be observed five years before. The reign ends with low values during the

years of Slavic invasions started in 576³⁵. The troubled times in the province are witnessed by three coin hoards concealed one in Barbaricum at Gropeni³⁶ (577/8) and two in Scythia. The later ones, ending with issues dated 574/5 and 576/7, were found both inside the walls of the fortress Halmyris lying on a burned layer. Despite the small chronological gape noticed by the latest coins of the hoards, they were probably buried with the same occasion. At the same time, in the fortress Beroe the coin circulation ends with a coin dated 575/6, found also in a burned level, while at Capidava the phase N2 ends during the same events³⁷.

A new reform is applied to the copper coinage during the first two regnal years of Tiberius II Constantine as sole ruler. The Emperor attempted to re-establish the former weight standard in use during the last years of Justinian's reign, as well as its ratio to the solidus. This measure was not to last throughout Tiberius II reign, as the value of the follis soon dropped. In Dobrudja the two stages (578-580 and 580-582) are equally balanced and both very far from the previous coefficient for the last period of Justin II. Nevertheless, a peak is noticed in the first year (480 nummia), which coincides with the attack led by Baian against the Slavs, as part of the agreement settled by Tiberius while he was co-emperor³⁸. Interesting enough is the fact that both at Tomis and Dinogetia coin finds from the first stage are completely missing.

The coin supply during the reign of Maurice Tiberius regresses to the values in the last stage of Anastasius (4.94%). At Halmyris we learn of a more dramatic situation (2.64%), marked also by a lack of finds for a decade 589/90-600/1. Meanwhile, the coin circulation seems more active on the seaside areas, at Callatis and especially Tomis (10.28%).

The Avar offensive of 585-586 seems to have affected only the southern part of Dobrudja, since the campaign followed the route Bononia-Ratiaria-Durostorum-Tropaeum-Zaldapa-Marcianopolis³⁹ and the coin supply remains at a rather stable level throughout the province⁴⁰. The town of Tropaeum was ravaged. For a long time scholars considered that it was never to recover after this moment, until few coins from the next period were found⁴¹. Meanwhile, Zaldapa managed to

⁴¹ V. Pârvan, *Cetatea Tropaeum*, 1911, pp. 190-191; I. Barnea in R. Vulpe and I. Barnea, *op. cit.*, p. 433. A specimen dating from 590/1 was reported by Gh. Poenaru Bordea, *Quelques monnaies trouvées à Adamclisi et la fin de Civitas Tropaenium*, Dacia, N. S., 12, 1968, pp. 410-411; Another confirmation comes from the small hoard found in 1993 (see below fn. 48).

survive the attack⁴². The imperial army regrouped and the counteroffensive led by Commentiolus during the next year pushed the Avars as far as the town of Tomis⁴³.

On the Danube, at Capidava, coin finds start from 587/8, while at Axiopolis the only specimen of Maurice is dated 590/1. Both coins come from the layer of the reconstruction process initiated after the Avar attack. In this respect two last peaks are noticed in 587/8 and 591/2. During 592/3 another Slavic attack may have occurred in Dobrudja⁴⁴, as the coin circulation ends at Dinogetia⁴⁵ and Troesmis⁴⁶, in 591/2, along with the phase IVB at Istrus⁴⁷ (after 593) and the hoard of Tropaeum (after 590/1)⁴⁸.

During the year 595 another Slavic invasion is mentioned in the southern part of Dobrudja, when Zaldapa was sacked and the capital Tomis has been besieged⁴⁹. Here, as a direct consequence, the coin finds for the year 595/6 are missing. For the entire province the currency flow drops seven times compared to the previous year, never to recover until the end of Maurice's reign. Connected to these events are probably two hoards concealed at Istrus. The so-called "Temple" and "Thermes" hoards seem to close with coins dated 593/4 and 594/5⁵⁰. Another hoard was found on the Danube's left bank, in "Barbaricum", at Unirea, with a terminus post quem 594/5, possibly related to the same Slavic attack⁵¹.

The reign of Phocas brings a considerable number of coin finds in Dobrudja, meaning the control was partially restored after the crisis of the year 602. The rebellion led by Phocas in 602

Butnariu, *Răspândirea monedelor bizantine din secolele VI-VII în teritoriile carpato-dunărene*, BSNR, 77-79, 1983-1985, 131-133, p. 228; Connected to the Slavic attack are a number of coin hoards in the Danube area: Fl. Curta, AnniIN, 43, 1996, pp. 156-161 (nos. 163-170).

underwent rather far from the territory of Scythia, and did not affect the province on the long term, as it was once believed⁵². Nevertheless the fortress Sacidava, close to the border with Moesia II, was sacked, as the archaeologists found a burned level that can be dated based on a coin, post 599/600⁵³. A small hoard from Istrus ends also with a coin dated 600/1⁵⁴. Although found in a rather uncertain archaeological context, it could testify that the town was endangered during the same events.

No more than two specimens dating from 602 were found in Dobrudja up to this moment, both at Tomis⁵⁵, but the coin circulation soon recovered up to 300 nummia in the next year and during the following period, possibly as a consequence of the peace treaty arranged with the Avars. It is worthy to mention that no coin hoard is doubtlessly buried in Scythia during the reign of Phocas and the trend is similar in the whole Danubian area⁵⁶. The last years of Phocas saw a military breakdown in Asia, where important towns fell to the Persians and in the Balkans, where the Avars attacked once again. The coin circulation reaches a dramatic level from 608 and it will not recover until the first years of Emperor Heraclius.

Until 616, the nummia per year coefficient still indicates a coin circulation in Dobrudja, while the next period provides only three specimens, the last one being dated 629/30⁵⁷. The downfall of the limes should therefore be placed around year 615, when the coin circulation ends in the major fortresses of the province: Capidava 612/3⁵⁸, Ibida 612/3⁵⁹, Argamum 613/4⁶⁰, Acres 613/4⁶¹, Istrus 613/4⁶², Halmyris 613/4⁶³, Aegyssus 613/4⁶⁴, Tomis 613/4⁶⁵, Axiopolis 614/5⁶⁶, Ulmetum 614/5⁶⁷

and Sacidava 615/6⁶⁸. In the rural areas the most recent coins, dated 613, come from the settlements at Sinoe⁶⁹ and Topolog⁷⁰.

Judging by the intensity of the coin circulation, the dismantlement started from the last decades of the sixth century, when some of the Scythian fortifications lost their military character, the urban life maintaining only in a few strongholds along the seaside until the first years of Heraclius' reign⁷¹.

The development in Scythia can be ascribed to the political events of the period, reflected in the fluctuations of the coin circulation. The downfall of 615 is taking place at a time when the Persians were ravaging Asia Minor and the important mints of Nicomedia (617/8) and Cyzicus (614/5) were temporarily shut-down⁷². Soon the Slavic tribes launched a powerful offensive in the Balkans reaching its climax with the siege of Constantinople in 626. A short revival occurred in 629-631, which coincides with the emperor's final defeat of the Persians, reflected also in the few specimens from this period found in Dobrudja⁷³. Later developments in coinage during the century did not find any response on the Scythian market, as the province was mostly out of the empire's sphere of influence.

The exchange-rate between copper and gold was mentioned as a more reliable indicator of the coin circulation and the true value of the copper currency present on the market. Based on the

theories of W. Hahn and J.-P. Callu⁷⁴, the coin sample from Dobrudja can be divided according to eight monetary reforms, with the results expressed in fractions of the solidus⁷⁵.

The new approach brings a few important changes into discussion. For the interval 498-538 the standing remains fairly balanced, only slightly higher according to Callu, with approximately 2% throughout the period. The peak reached during the reign of Justin I is thus confirmed, surpassing the coefficient from the first stage of Justinian's reign. A spectacular overturning occurs after the reform of the year 538, when Justinian introduced a heavier follis, one of the few occasions in Byzantine history when the face-value of the copper coinage began to approach its bullion-value. Therefore it provides higher coefficients compared to the nummia per year calculation, bringing this reform interval (538-542) on the first place of the overall classification. The coin circulation during Justinian's reign is far more intense than it was expected upon the previous results, which totalized 28.19%, compared to 43.52% (Hahn) or 43.42% (Callu).

The reign of Justin II is characterized by an abundance of currency on the market. The number of folles exchanged for a solidus rises to 525 and than to 720, meaning inflation and economic crisis explained above by the precarious political and financial situation of the Empire. Although with a doubtless progress compared to the disastrous last stage of Justinian's reign, the reform performed by Justin II was not meant to last, as the following period brings gradually lower values.

An ambitious reform is attempted by Tiberius II Constantine who tries to lift the weight of the follis to a previous value of the period 550-565. The Empire is economically incapable of sustaining such an effort and his initiative is brought to a quick end by a new reduction in weight and a debasement in relation to the solidus. The decline is inevitable and within two years the exchange rate reaches 600 folles/ solidus, maintained for the following decades. For the last stage the coefficients drop more severely judging by the folles/ solidus calculus, testifying that Dobrudja was under great threat during its last years under Roman rule.

Another important issue is establishing the presence and proportion of mints to supply the provincial market, judging by a sample of 1294 specimens with a clear mint attribution. A

⁷⁴ See fn. 13. Such an approach was undertaken more than two decades ago concerning the important collection at the Museum in Constanța: Gh. Poenaru Bordea and R. Ocheșanu, SCIVA, 3, 1980, pp. 377-396.

⁷⁵ See appendix, table 6-7.

comparison with the results provided by the main fortresses of the province could also prove useful for any fluctuations that might have occurred at certain moments⁷⁶.

Table 4. The coin distribution upon mints.

Mint	No. Of Coins	% No. of Coins	Position	No. of Nummia	% No. of Nummia	Position
Constantinople	767	59.28%	I	23015	63.27%	I
Thessalonica	206	15.92%	II	4096	11.26%	III
Nicomedia	191	14.76%	III	5585	15.35%	II

Cherson	2	0.15%	VIII	60	0.17%	VII
Alexandria	2	0.15%	VIII	45	0.12%	VIII
Ravenna	1	0.08%	IX	40	0.11%	IX
TOTAL	1294	100%		36376	100%	

The metropolitan mint has the most important presence among the coin finds, followed far behind by the provincial mints of Thessalonica and Nicomedia, equally balanced in terms of number of coins. We should take into account the fact that Thessalonica struck especially half-folles, while Nicomedia issued more folles, therefore Nicomedia being higher ranked in what concerns the number of nummia.

The once extensive system of Roman provincial mints had collapsed by the time of Anastasius' accession, when only Constantinople and Thessalonica remained in business, the latter issuing only gold denominations. The vast majority of coins found in Dobrudja dating from this period are issued by the metropolitan mint (92.30%), assisted by Nicomedia, re-commissioned after the reform of 498, and to a lesser degree by Antioch, opened in 512. No coins struck at Thessalonica are present among the coin finds until the reign of Justinianus, when new copper denominations were created.

The reign of Justin I saw a further extension of the mint system by the re-opening of Cyzicus destined to supply the Diocese Asiana and only with a symbolical presence in Scythia at this point. The Nicomedian mint plays a more important role as shown particularly at Tomis (22.72%), on the Black Sea⁷⁷.

The highest expansion of the provincial mint system was reached during Justinian's long reign when no less than ten mints supplied Scythia⁷⁸, although Constantinople maintains a very high percentage (66.07%). Nevertheless, Nicomedia and even Antioch are more present on the market, while Thessalonica provides only few specimens, usually half-folles dating from the last years of his reign.

Important changes occurred during the reign of Justin II when the market is invaded by half-folles issued at Thessalonica (32.03%), a tendency applied to all the major centres of the province. Later on, the reign of Tiberius II saw a new overturning, Nicomedia taking Thessalonica's place in terms of coin supply, while Antioch becomes more active. During the reign of Maurice, Thessalonica and its half-folles partially regain the former position in a rather balanced classification of the five important mint centres, while for the reign of Phocas we have to notice the important number of coins brought from Cyzicus, unparalleled throughout the period.

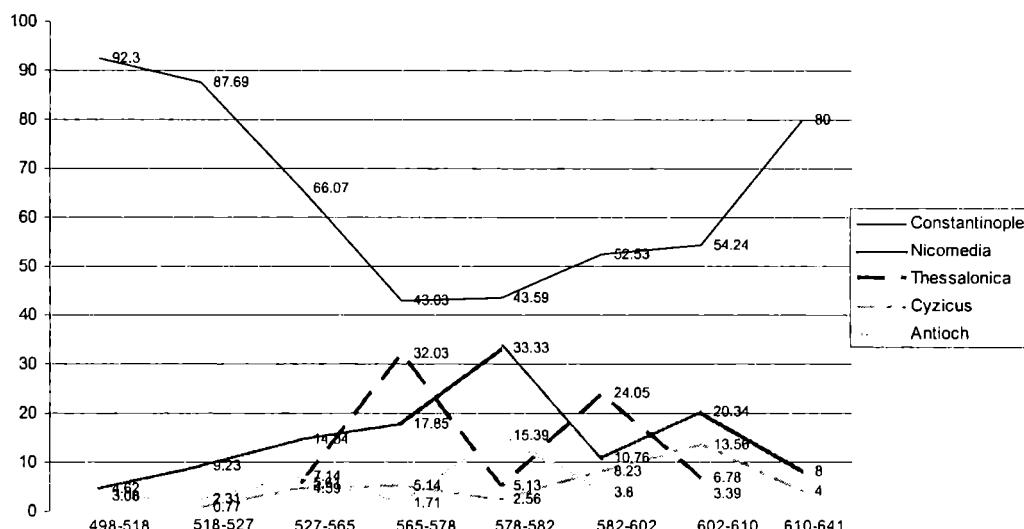

⁷⁶ See appendix, table 4.

⁷⁷ Th. Isvoranu and Gh. Poenaru Bordea, *Simpozion de numismatică*, 2003, p. 154, table 5.

⁷⁸ Added to the nine mints in table 5 is the specimen struck at Cherson from the MNHAC collection.

The troubled times of the first half of the seventh century saw a rapid reduction in the number of mints, first Antioch, then Nicomedia, Cyzicus and Thessalonica, all with a constant presence in Dobrudja throughout the sixth century. The metropolitan mint regains once more its overwhelming percentage (80%) from the beginning of the century.

As a result of the reform of coinage carried out at the end of the fifth century, a whole new range of copper denominations was created as multiples of the basic nummus. Therefore a matter worthy to discuss should be the variety and proportion of various denominations found in Dobrudja. The results are primarily connected with the market demands, but also with some local peculiarities in the mints' activity, sometimes specialized in providing certain denominations as shown above.

In the time of Emperor Anastasius we notice the prevalence of half-folles, a rather common feature throughout the period, Istrus alone providing a larger number of folles⁷⁹. Jumping to the age of Justinian, the most striking would be the large number of dekanummia (138 sp.), most of them entering Dobrudja during the last ten years of the reign. Even more, at Tomis the number of dekanummia represents almost half of the entire batch from Justinianus⁸⁰. Smaller denominations also maintain a high percentage at Tomis during the reign of Justin II, when pentanummia enter the town in great numbers (31.88%) and to a lesser degree in the other fortresses. The reform attempted by Tiberius II insured the presence of small copper in Dobrudja and even of a few scarcer specimens of three-quarter folles. Starting with the reign of Maurice Tiberius, the number of smaller denominations begins to decrease in the coin finds and they finally disappear from the market in the time of Heraclius, when the majority of coins are pieces of forty nummia.

The present survey and its statistical results will eventually be updated after new coin finds and possibly after the publication of some important samples still unpublished after a long time⁸¹. Although the main trends in the coin circulation could still stand in the years to come, further developments might prove valuable in the debate upon the political events underwent at the Lower Danube during its last century under Roman rule. Therefore we must wait for future research to provide answers and to shed more light on the still unclear issues concerning the coin circulation and the history of Dobrudja during the sixth and seventh century.

B. HOARDS⁵⁸³

1. ADAMCLISI - TROPAEUM TRAJANI (Constantza County)

I. 1908⁵⁸⁴. Found in a ceramic jug near the basilica „cisternă” inside the town walls. It includes 76-77 copper coins, a gold ring and 25 gold coins, the latter possibly indicating that the hoard might be the treasure of the town Church. Only 49 specimens are still available, with the last coin dated 584/5.

⁵⁸³ Apart from the hoards presented in the article there is a number of hoards either uncertain as a hoard or of its finding place or comprising precious metal coins during the 7th century after the end of the coin circulation in Scythia: Constantza 1938, 5 AE (Heraclius-Constans) published by a collector who had the information from another collector (I. Dimian, SCN, I, 1957, p. 197) and considered afterwards as being a hoard or part of a hoard (D. M. Metcalf, Some coins and Coin Hoards from the reign of Heraclius, BSA, 57, 1962, p. 20, fn. 29); Valea Teilor, 2 AR (Constans II-Constantine IV; E. Oberländer-Târnoveanu, SCN, 7, 1980, p. 163). The coin hoards found in the Bulgarian part of Dobrudja (Siliстра, Zaldapa, Kavarna, Bălgarevo) will be included in future contributions hopefully along with the single coin finds.

2. AXIOPOLIS⁵⁸⁶ (Cernavodă, Constantza County)

1899. Found in a chamber close to the northern gate, it includes 1 semissis and 5 tremissis:

Justinian I - 1 tremissis.

Justin II - 1 tremissis.

Tiberius II Constantine - 1 semissis +3 tremissis.

3. CONSTANTZA-ANADOLCHIOI

1929⁵⁸⁷. Found outside the town walls of ancient Tomis in a residential area of the modern city, it contains 400 coins of which 383 were eventually recovered. A number of 252 specimens are prior to the Anastasian reform. The last dated coins in the hoard are two half-folles from 545/6.

OVERALL	22/840	4/80	7/220	2/60	2/30	1/10	38/1240

6. OLTINA-CÂSLA⁵⁹⁴ (Constantza County)

Anastasius I – 1 AE.

Justinian I – 1 AE.

Justin II – 4 AE.

Maurice Tiberius – 2 AE.

The last coin is dated 591-592.

⁵⁹³ Cristina Opaiț, Peuce, 10, 1991, pp. 478-481; Gh. Poenaru Bordea, in Al. Suceveanu et al., *op. cit.*, pp. 165-170.

⁵⁹⁴ E. Oberländer-Târnoveanu, Peuce, 14, 2003, p. 377, fn. 138.

7. SATU NOU⁵⁹⁵ (Tulcea County)

1912. On the Danube's bank were found 25 coins all being attributed at that moment to Justinian I. The present location of the coins is unknown.

8. SLAVA RUSĂ⁵⁹⁶ (Tulcea County)

1988. During the excavation of a sixth century monastery near Slava Rusă 8 solidi were found, probably struck at the metropolitan mint.

Justinian I - 1 AV

Maurice Tiberius - 7 AV

9. TOPALU⁵⁹⁷ (Constantza County)

The hoard was found north of Topalu on the Danube's right bank and it includes 55AE. When first published by I. Dimian, the coins were attributed without exception to Justinian I, but later on Gh. Poenaru Bordea noticed three demi-folles dated with regnal years I, II, III, therefore attributed to Justin II. Still, the hoard, with unkown present whereabouts, contains a follis struck at Cyzicus during the regnal year 7 and, if the date was correctly read by I. Dimian, the last coin in the hoard should be dated 571/2 instead of 567/8.
